19

20 7 **Purpose (limit 100 words)**
21
22

23 8 Despite increasing interest in telemedicine, its impact on tourism remains underexplored. This study
24 9 analyses how telemedicine apps improve healthcare access for tourists, emphasizing usability,
25 10 benefits, challenges, and safety perceptions, while identifying integration barriers and opportunities.
26
27
28

29 11 **Design/methodology/approach (limit 100 words)**
30
31

32 12 This study employs a qualitative approach using Grounded Theory to develop a structured
33 13 understanding of telemedicine's role in tourism. Data collection involved semi-structured in-depth
34 14 interviews, participant observation, and document review with 10 experts from medicine, tourism,
35 15 app development, consumer advocacy, and academia, recruited through theoretical sampling. The
36 16 analysis employed ATLAS.ti software with open, axial, and selective coding to generate themes and
37 17 construct a theoretical framework.
38
39

41
42

43 18 **Findings (limit 100 words)**
44
45

46 19 Telemedicine apps, primarily designed for medical management, also enhance tourist safety.
47 20 However, usability challenges for older users and poor integration with tourism services hinder their
48 21 adoption. Experts emphasized the importance of accessibility and user-friendly design, while concerns
49 22 about medical data security were minimal.
50
51
52
53

54 23 **Originality/value (limit 100 words)**
55
56

57 24 This research provides novel insights into the connection of telemedicine and tourism, highlighting
58 25 how telemedicine apps can enhance tourist safety and convenience. By integrating expert
59
60

1
2
3 26 perspectives, the study offers practical recommendations for tourism stakeholders and app developers
4
5 27 to foster innovation and adoption in both sectors.
6
7

8 28 **Research limitations/implications (limit 100 words)**
9

10 29 The findings are based on a small sample size of experts. Future studies could broaden the participant
11
12 30 sample and include actual tourists to gain deeper insights.
13
14

15 31 **Practical implications (limit 100 words)**
16

17 32 Tourism providers should partner with telemedicine developers to enhance tourist safety. Training
18
19 33 older users will improve adoption rates.
20
21

22 34 **Social implications (limit 100 words)**
23

24
25 35 Integrating telemedicine into tourism can improve access to healthcare, reduce travel-related health
26
27 36 risks, and promote proactive health management among tourists, benefiting public health. However,
28
29 37 the widespread adoption of telemedicine in tourism requires alignment with existing data protection
30
31 38 regulations such as the GDPR in Europe and the HIPAA in the United States.
32

40

41 1. Introduction

42 Although well-researched in traditional healthcare, its impact on general tourism remains
43 underexplored, highlighting a research gap. Telemedicine *apps* facilitate cost-effective and convenient
44 access to healthcare services, particularly in underserved areas (Huang, 2018). Their role extends
45 beyond traditional healthcare by providing remote consultations, real-time health monitoring, and
46 emergency guidance, making them essential for tourists navigating unfamiliar or resource-limited
47 settings. These *apps* improve safety by offering real-time health monitoring and medical guidance in
48 unfamiliar environments. Bidirectional communication is a key characteristic of smart services (Gao
49 & Huang, 2019). While telemedicine *apps* offered by tech start-ups are gaining popularity, there
50 remains a prevailing sentiment among the public that hospitals should be the primary providers of
51 these services (Yuswohady et al., 2021).

52 Currently, consumers use multiple channels (offline and online) to become familiar with and purchase
53 products (Verma & Yadav, 2021) or services. Globalization and healthcare privatization have
54 increased cross-border medical travel, emphasizing the need for accessible, cost-effective digital
55 healthcare solutions (Collins et al., 2022). As tourism expands, telemedicine presents a viable
56 alternative for managing healthcare needs abroad. Prior research has primarily focused on medical
57 tourism, overlooking the everyday health challenges faced by tourists. This study bridges that gap by
58 examining how telemedicine can enhance healthcare accessibility, mitigate risks, and improve safety
59 perceptions among tourists.

60 Moreover, healthcare systems and stakeholders are repositories of a huge amount of collectable and
61 codified knowledge which can potentially reduce the risk of medical errors and properly inform
62 healthcare decision-makers (Leone et al., 2021). Remote health monitoring systems and smart
63 wearable devices together with a cloud-based telemedicine platform can contribute significantly to
64 the prevention of diseases by enabling early diagnosis and management, and consequently managing
65 treatment and rehabilitation of the patients (Papa et al., 2020).

66 [Figure 1].

67 This qualitative research aims to determine the key factors influencing the effectiveness of
68 telemedicine *apps* and explore potential healthcare safety issues that may arise during travel. This

69 study investigates the impact of telemedicine apps on tourists' healthcare safety perceptions, assessing
70 usability, accessibility, and integration challenges. By addressing these critical issues, this study seeks
71 to bridge the gap in understanding how telemedicine can enhance healthcare safety for tourists,
72 offering both theoretical and practical contributions.

73 Despite growing research on medical tourism, little attention has been given to how telemedicine can
74 support general tourists who experience unexpected health issues abroad. This study examines
75 telemedicine's impact beyond planned medical travel, identifying practical use cases and adoption
76 barriers. The specific objectives are as follows:

- 77 1. Assess the usefulness of telemedicine *apps* for health monitoring and identify the factors
78 contributing to this perception.
- 79 2. Identify the benefits of telemedicine *apps* usage by tourists, including motivators and influencing
80 factors essential for evaluating healthcare safety.
- 81 3. Highlight the drawbacks of telemedicine *apps* usage, examining how these disadvantages may
82 affect the relationship between utility and healthcare safety, particularly during travel.
- 83 4. Examine the relationship between telemedicine *apps* usage and perceived healthcare safety among
84 tourists.

85 These four research objectives have been elaborated upon and organized into four conceptual
86 networks, each giving rise to a major grouping of codes (hereinafter referred to as code families or
87 CFs): usefulness for health monitoring, advantages of telemedicine *apps*, disadvantages of
88 telemedicine *apps*, and safety in travel healthcare (see Figure 2). This approach provides a structured
89 framework for examining the multifaceted role of telemedicine in tourism, enabling a comprehensive
90 analysis of its implications for both users and service providers.

91 [Figure 2].

92 **2. Literature review and theoretical background**

93 **2.1 Telemedicine and digital health technologies**

94 Telemedicine applications have become pivotal in ensuring accessible and safe healthcare for tourists.
95 Advancements in digital health technologies have revolutionized the delivery of remote medical care,
96 breaking down geographical barriers and increasing healthcare efficiency (Gajarawala & Pelkowski,

1
2
3 97 2021). These technologies influence bidirectional communication and cloud-based platforms to
4
5 98 facilitate health monitoring, early diagnosis, and effective treatment management (Papa et al., 2020).
6

7
8 99 The integration of the Internet of Things (IoT), wearable sensors, and real-time monitoring
9
10 100 technologies is transforming telemedicine by enhancing predictive healthcare and remote diagnostics
11 101 (Albahri et al., 2021). These innovations, including wearable electrochemical sensors (Faham et al.,
12 102 2023), facilitate continuous health tracking, making telemedicine particularly valuable for tourists in
13 103 remote locations. By bridging digital health and tourism, these technologies provide tourists with
14 104 proactive healthcare solutions, improving both prevention and emergency response measures. These
15 105 technologies are especially beneficial for tourists in medically underserved regions, ensuring proactive
16 106 health management and early detection of medical issues.
17
18
19
20
21

22 107 Advancements in artificial intelligence (AI) have further refined telemedicine capabilities. Recent
23 108 research has emphasized the importance of Electronic Health Records (EHRs) in facilitating remote
24 109 healthcare, improving patient data accessibility, and optimizing digital health ecosystems (Khashan
25 110 et al., 2024). The successful adoption of EHRs significantly influences the efficiency of telemedicine
26 111 services, reducing administrative burdens and enabling seamless coordination between healthcare
27 112 providers and tourists requiring medical attention abroad. However, studies indicate that physicians'
28 113 adoption of EHRs is influenced by multiple factors, including perceived usefulness, ease of use,
29 114 organizational support, and technology readiness (Khashan et al., 2024). These insights highlight the
30 115 importance of well-integrated digital health infrastructures in expanding telemedicine's role in
31 116 tourism. Pieczynski et al. (2021) and Huang et al. (2022) reveal how AI-enhanced telemedicine
32 117 supports remote screening and diagnosis, particularly during patient isolation, leading to better
33 118 healthcare outcomes and efficiency.
34
35
36
37
38
39
40
41
42
43

44 119 Digital health technologies continue to evolve with the integration of behavioural insights into mobile
45 120 health adoption. Consumer adoption of digital health *apps* depends on factors such as trust, social
46 121 influence, and health consciousness, extending beyond mere technological ease of use (Dahiya &
47 122 Saini, 2024). This is particularly relevant to telemedicine adoption in tourism, where tourists' trust in
48 123 digital healthcare solutions, influenced by recommendations from peers and healthcare providers,
49 124 significantly impacts adoption rates.
50
51
52
53
54

55 125 A holistic framework for the adoption determinants of mobile health (M-health) applications has been
56 126 proposed to analyse user behaviour, highlighting factors such as hedonic motivations, perceived
57 127 behavioural control, and social influence (Najib Al-Jabali & Ahmad, 2025). This systematic review
58
59
60

1
2
3 128 identified that despite the increasing penetration of smartphones, low engagement, digital literacy
4
5 129 gaps, and a lack of healthcare provider involvement remain major barriers to mobile health adoption.
6
7 130 Understanding these gaps is particularly relevant to telemedicine adoption in tourism, where tourists
8
9 131 often lack familiarity with digital healthcare ecosystems and require simplified, intuitive health
10 132 interfaces for optimal engagement.
11

12
13 133 Trust plays a crucial role in the adoption of telemedicine and online healthcare platforms, significantly
14
15 134 influencing consumers' willingness to engage with digital health services. The Unified Theory of
16 135 Acceptance and Use of Technology (UTAUT) model, widely applied in digital health research,
17
18 136 highlights that perceived trust moderates the relationship between effort expectancy, performance
19
20 137 expectancy, and social influence in technology adoption (Saraswat & Singh, 2025). This is particularly
21
22 138 relevant in telemedicine adoption among tourists, where users may be hesitant to engage with
23 139 unfamiliar healthcare systems due to concerns about data security, service legitimacy, and regulatory
24
25 140 inconsistencies across countries.
26

27
28 141 Recent research has further refined theoretical models for telemedicine adoption, expanding beyond
29
30 142 Technology Acceptance Model (TAM) and UTAUT. The Modelling Telemedicine Adoption
31 143 framework (Chanda et al., 2025) emphasizes additional determinants such as digital literacy,
32
33 144 stakeholder collaboration, and regulatory harmonization as key factors influencing telemedicine
34
35 145 acceptance. This model suggests that while technological factors play a crucial role, successful
36 146 adoption depends on broader systemic enablers, including government support, healthcare institution
37
38 147 engagement, and inter-industry cooperation.
39

40
41 148 Telemedicine also plays a transformative role in nursing practices. David-Olawade et al. (2024)
42
43 149 describe tele-triage, remote monitoring, and virtual consultations as essential tools for reducing
44 150 emergency department congestion and improving chronic condition management. These integrations
45
46 151 not only enhance operational efficiency but also promote timely, patient-centered healthcare,
47
48 152 addressing disparities in healthcare access.
49

50 153 **2.2 Global challenges in telemedicine adoption**

51

52
53 154 While telemedicine is transformative, its adoption faces significant barriers across global contexts.
54
55 155 Cultural perceptions, regulatory challenges, and infrastructural limitations impede its widespread
56 156 implementation. For example, Luciano et al. (2020) contrast regulatory hurdles in the U.S. with
57
58 157 infrastructural challenges in Brazil. Similarly, Yigzaw et al. (2024) highlight the need to balance
59
60 158 stringent data privacy regulations, such as General Data Protection Regulation (GDPR) and Health

1
2
3 159 Insurance Portability and Accountability Act (HIPAA), with efficient healthcare delivery. In Sub-
4 160 Saharan Africa, financial constraints, cultural resistance, and inadequate technological infrastructure
5 161 further hinder adoption (Dodoo et al., 2021).
6
7
8

9 162 In addition to data protection regulations such as GDPR and HIPAA, studies emphasize the
10 163 importance of stakeholder-driven governance models for telemedicine adoption (Ojha & Agarwal,
11 164 2025). Without clear frameworks for cross-border telemedicine services, tourists may face regulatory
12 165 uncertainties regarding data privacy, liability, and service continuity. Policymakers must balance
13 166 regulatory enforcement with innovation-friendly policies to facilitate telemedicine access across
14 167 different jurisdictions.
15
16
17
18
19

20 168 The COVID-19 pandemic significantly accelerated the adoption of telehealth, forcing both healthcare
21 169 providers and patients to rapidly transition to remote healthcare solutions. Maleka and Matli (2024)
22 170 highlight that, although telehealth improved healthcare accessibility during the crisis, concerns over
23 171 its long-term sustainability persist. Their study found that, despite telehealth's cost-effectiveness and
24 172 convenience, factors such as a lack of face-to-face interactions, privacy concerns, and disparities in
25 173 digital literacy have hindered its continued use beyond the pandemic. These findings underscore the
26 174 importance of regulatory frameworks that ensure both security and accessibility while maintaining
27 175 telehealth as a viable solution for tourists and underserved populations.
28
29
30
31
32

33 176 Data security remains a critical concern. Centralized storage systems increase risks of data breaches,
34 177 undermining trust in telemedicine platforms (Hiwale et al., 2023). Emerging solutions, such as
35 178 blockchain and federated learning, provide decentralized and secure frameworks for healthcare data
36 179 management. However, resistance to adopting telemedicine persists in resource-limited areas, often
37 180 due to a lack of infrastructure and healthcare professionals' preference for traditional practices
38 181 (Haleem et al., 2021).
39
40
41
42
43
44
45
46

47 182 Resistance to telemedicine adoption extends beyond technological barriers, encompassing socio-
48 183 cultural hesitations and stakeholder misalignment. Studies indicate that while tourists express interest
49 184 in telemedicine solutions, scepticism toward digital healthcare services, particularly in regions with
50 185 strong traditional medicine practices, remains a barrier (Chanda et al., 2025). In response, tailored
51 186 public awareness campaigns and strategic partnerships between tourism and healthcare sectors can
52 187 facilitate a more seamless adoption process.
53
54
55
56
57

58 188 Addressing these barriers requires tailored strategies, including investments in digital infrastructure,
59 189 culturally sensitive education programs, and region-specific telehealth adaptations. Estonia's success

1
2
3 190 in implementing blockchain-based healthcare systems offers a replicable model for addressing data
4
5 191 security and improving access (Liu et al., 2023). Overcoming these barriers will enable telemedicine
6
7 192 to deliver equitable, efficient, and accessible healthcare services globally.
8

9
10 193 Despite the promise of mobile health technologies, existing disparities in healthcare accessibility and
11 194 digital literacy continue to hinder adoption. Research highlights that M-health applications often lack
12
13 195 user engagement due to issues such as low adherence, variations in usage motivation, and limited
14
15 196 customization for diverse populations (Najib Al-Jabali & Ahmad, 2025). These findings are
16
17 197 particularly relevant in telemedicine adoption for tourism, where tourists from different cultural and
18 198 economic backgrounds may encounter difficulties in accessing or trusting digital healthcare services.
19
20 199 Developing localized telemedicine platforms that address linguistic, financial, and technological
21
22 200 barriers could significantly improve user adoption rates among tourists.
23

24 201 **2.3 Telemedicine benefits and barriers for tourists**

25
26
27 202 Telemedicine offers unique advantages for tourists, addressing healthcare challenges during travel.
28
29 203 Real-time teleconsultations provide medical advice in multiple languages, enhancing healthcare
30
31 204 accessibility and reducing travel-related anxiety (Pandit et al., 2024). Telemedicine apps streamline
32 205 appointment scheduling, record access, and follow-up healthcare, offering a reliable alternative to
33
34 206 traditional services, particularly in remote destinations (Alexandra et al., 2021). These features
35
36 207 improve service quality and ensure continuity of healthcare for tourists managing chronic conditions
37 208 (Rouidi et al., 2022).
38

39
40 209 Beyond its general benefits, telemedicine plays a crucial role in chronic disease management and
41
42 210 remote pain treatment, particularly for tourists with pre-existing conditions. The economic impact of
43
44 211 telemedicine adoption in tourism is another crucial aspect that requires further exploration. Studies
45 212 show that incorporating telemedicine solutions into tourism infrastructures not only improves
46
47 213 healthcare access but also generates economic benefits for local healthcare providers by increasing
48
49 214 patient reach (Chanda et al., 2025). By integrating telemedicine with tourism services, governments
50 215 and private enterprises can create sustainable business models that enhance both public health
51
52 216 outcomes and local economic development.
53

54
55 217 Recent studies have expanded the UTAUT model by incorporating perceived trust as a moderating
56
57 218 factor in the adoption of digital health technologies. Findings suggest that while performance
58 219 expectancy and effort expectancy positively influence adoption intentions, the presence or absence of
59
60 220 trust can significantly alter these relationships (Saraswat & Singh, 2025). This is particularly critical

1
2
3 221 in the tourism sector, where tourists may be reluctant to engage with telemedicine platforms due to
4
5 222 concerns over healthcare credibility, medical accuracy, and privacy risks. As a result, tourism and
6
7 223 healthcare stakeholders must prioritize trust-building strategies, including endorsements from
8
9 224 recognized healthcare institutions, transparent pricing structures, and compliance with international
10 225 health regulations, to encourage widespread adoption.
11
12

13 226 Emerging research suggests that social media engagement plays a crucial role in shaping public
14
15 227 perceptions of telemedicine (Dass et al., 2024). The integration of social media marketing and digital
16
17 228 healthcare services has been found to significantly impact telemedicine adoption intentions,
18 229 particularly in post-pandemic contexts. The study further highlights that privacy concerns and
19
20 230 COVID-19-induced anxiety negatively affect consumer confidence in telemedicine, while positive
21
22 231 emotional engagement with online health content enhances telemedicine adoption. These insights
23 232 suggest that tourism and telemedicine stakeholders should leverage social media campaigns to
24
25 233 improve telemedicine credibility and drive user adoption among tourists.
26
27

28 234 El-Tallawy et al. (2024) highlight how telemedicine has significantly enhanced access to pain
29
30 235 management services, particularly for individuals with mobility challenges or those requiring long-
31 236 term monitoring. Their findings indicate that telemedicine reduces the burden of in-person visits,
32
33 237 allowing continuous remote support and specialized pain management interventions. This is
34
35 238 particularly relevant for tourists who may struggle to access consistent medical care abroad.
36 239 Integrating telemedicine solutions into tourism-focused healthcare services could therefore provide
37
38 240 targeted support for tourists managing chronic pain, ensuring they receive appropriate medical
39
40 241 guidance regardless of location.
41
42

43 242 The wider adoption of telemedicine in crisis scenarios, such as the COVID-19 pandemic, has
44 243 demonstrated its effectiveness in maintaining healthcare access while minimizing patient exposure to
45
46 244 risks. Toni and Ayatollahi (2024) highlight that telemedicine has proven particularly beneficial for
47
48 245 vulnerable populations, including cancer patients, who were at high risk during the pandemic. Their
49 246 findings indicate that teleconsultation, tele-visits, and telerehabilitation significantly reduced hospital
50
51 247 admissions and improved patient-reported outcomes, demonstrating telemedicine's potential beyond
52
53 248 emergency situations. These insights are particularly relevant to the tourism sector, where tourists
54 249 frequently face medical uncertainties in foreign environments. Adapting telemedicine services to
55
56 250 tourist needs could enhance both preventive healthcare and emergency response, ensuring a more
57
58 251 resilient and accessible healthcare system for tourists worldwide.
59
60

1
2
3 252 However, barriers to adoption persist. Older tourists often struggle with the complexity of
4 253 telemedicine *apps*, discouraging use (Blok et al., 2020). Privacy concerns regarding medical data
5 254 further limit adoption, though trust in *app* providers can mitigate these fears (Rouidi et al., 2022).
6
7 255 Additionally, the reliance on stable Internet connectivity restricts access in remote or underserved
8
9 256 destinations (Ftouni et al., 2022).
10
11

12
13 257 Recent research on mobile health technology adoption underscores additional barriers to accessibility.
14
15 258 Chan and Zhuo (2024) examined mobile health adoption among low-income working adults and found
16 259 that digital literacy challenges, privacy concerns, and a lack of awareness of available health *apps*
17 260 were key obstacles limiting usage. Their findings suggest that even in highly digitized societies,
18 261 mHealth adoption is constrained by usability complexities and a preference for general web searches
19 262 over dedicated health *apps*. These insights are highly relevant to telemedicine adoption in tourism,
20 263 where tourists often face similar challenges in navigating digital health solutions due to unfamiliar
21 264 healthcare systems and varying levels of digital literacy across global destinations. Understanding
22 265 these adoption barriers is essential for designing *more intuitive, accessible telemedicine solutions
23 266 that cater to diverse user demographics, including tourists and low-income groups.
24
25

26
27
28
29
30
31 267 Beyond user-related barriers, effective telemedicine integration within tourism requires strong
32 268 management competencies at various levels of healthcare leadership. Ylitalo et al. (2023) emphasize
33 269 that primary healthcare managers play a critical role in the successful deployment of digital health
34 270 solutions. Their study highlights how managers at different levels (frontline, middle, and senior) must
35 271 develop specific digital health competencies to facilitate telemedicine adoption. Frontline managers
36 272 focus on guiding healthcare personnel and users, middle managers coordinate digital health initiatives,
37 273 and senior managers oversee large-scale integration efforts. These leadership dynamics are essential
38 274 in tourism-driven telemedicine solutions, where seamless coordination between healthcare providers,
39 275 tourism stakeholders, and policymakers is required to ensure sustainable implementation.
40
41
42
43
44

45
46
47 276 The adoption of telemedicine in tourism is not solely dependent on technological factors but also on
48 277 stakeholder engagement, including healthcare providers, regulatory bodies, and tourism businesses.
49 278 The TAM has traditionally been applied to assess digital health adoption. However, recent research
50 279 suggests that expanded models incorporating behavioural and social determinants provide a more
51 280 accurate representation of user engagement with telemedicine (Dahiya & Saini, 2024). The inclusion
52 281 of personal innovativeness, social influence, and health consciousness as key adoption factors
53 282 demonstrates that users are more likely to engage with telemedicine *apps* when they align with their
54 283 perceived lifestyle needs and digital literacy levels. In tourism, where tourists' health behaviours differ
55
56
57
58
59
60

1
2
3 284 from routine settings, incorporating behavioural adoption models could enhance service
4
5 285 personalization and increase user engagement.
6

7
8 286 Research highlights that successful telemedicine implementation requires cross-sector collaboration,
9
10 287 digital literacy enhancement, and trust-building measures among both tourists and service providers
11 288 (Ojha & Agarwal, 2025). Ensuring a seamless telemedicine experience for tourists demands
12
13 289 coordinated efforts from travel agencies, insurance companies, and healthcare institutions to create
14
15 290 integrated digital health ecosystems. The Technology Readiness and Acceptance Model (TRAM) has
16
17 291 been widely used to analyse physicians' adoption of EHR systems, providing insights into how
18 292 innovativeness, optimism, discomfort, and insecurity influence the adoption of healthcare
19
20 293 technologies (Khashan et al., 2024). The TRAM framework suggests that while positive technology
21
22 294 readiness factors (innovativeness, optimism) drive digital health adoption, negative factors
23 295 (discomfort, insecurity) pose barriers to usability. This model aligns with UTAUT and TAM,
24
25 296 highlighting that stakeholders' perceptions play a crucial role in the digital transformation of
26
27 297 telemedicine in tourism.
28

29
30 298 Technology adoption in healthcare is often analyzed using established frameworks, including TAM
31 299 (Davis, 1989) and UTAUT (Venkatesh et al., 2003). These models provide insights into user behavior
32
33 300 and factors influencing the acceptance of digital health solutions. While TAM focuses on perceived
34
35 301 ease of use and usefulness, UTAUT expands this by incorporating social influence, facilitating
36 302 conditions, and effort expectancy (Williams et al., 2015). Studies applying these models in
37
38 303 telemedicine emphasize the critical role of digital literacy, trust, and regulatory alignment in adoption
39
40 304 rates (Rouidi et al., 2022). Theoretical models such as TAM and UTAUT remain central to
41
42 305 understanding digital health adoption; however, recent studies suggest the necessity of hybrid
43 306 frameworks that incorporate stakeholder perspectives and policy-driven incentives (Chanda et al.,
44
45 307 2025). The Modelling Telemedicine Adoption framework extends traditional models by incorporating
46
47 308 system-wide enablers such as health tourism policies, interoperability standards, and inter-sectoral
48
49 309 cooperation. Applying this framework to telemedicine adoption in tourism offers a more
50 310 comprehensive understanding of how multiple factors interact to influence user engagement and long-
51
52 311 term sustainability.
53

54
55 312 Recent research has highlighted the relevance of UTAUT2 in understanding e-consultation adoption,
56 313 particularly among healthcare professionals in emerging economies. Dash and Sahoo (2023) applied
57
58 314 UTAUT2 to investigate physicians' perceptions of e-consultation services during the COVID-19
59
60 315 pandemic, demonstrating that facilitating conditions, effort expectancy, and social influence were the

1
2
3 316 strongest predictors of adoption. However, their findings also indicated that habit and experience had
4
5 317 minimal impact, challenging assumptions about long-term behavioral intention in telemedicine. These
6
7 318 insights are particularly relevant for tourism-related telemedicine services, where intermittent usage
8
9 319 patterns, cross-border healthcare access, and variable regulatory environments may influence adoption
10 320 differently compared to traditional healthcare settings.
11
12

13 321 **3. Methodological procedure**

14 15 322 **3.1 Research design**

16
17
18 323 This study adopts a qualitative approach precisely because of the absence of established theoretical
19 324 frameworks linking telemedicine *apps* and their role in general travel experiences. A significant gap
20 325 remains in understanding how digital health solutions influence tourist behaviour and healthcare
21 326 decision-making abroad. The study aims to develop a conceptual model integrating telemedicine and
22 327 tourism. A literature review preceded the qualitative study to refine its focus and enhance interview
23 328 quality.
24
25
26
27
28
29

30 329 The study adopts a qualitative approach to examine the practical challenges and advantages of
31 330 telemedicine adoption in tourism, using expert interviews and coding (Strauss & Corbin, 2015).
32 331 Within the qualitative methodology scope, after considering various options, it has been determined
33 332 that the most appropriate approach to follow is Grounded Theory (hereinafter, GT) as it employs a
34 333 series of coding techniques that inductively generate an explanatory theoretical basis of a
35 334 phenomenon. Both authors developed approaches to GT (Charmaz, 2006; Gibson & Brown, 2009;
36 335 Strauss & Corbin, 2015).
37
38
39
40
41
42

43 336 Consequently, this research adopts the approach outlined by Strauss and Corbin (2015) and Pandit
44 337 (1996). The decision to select this methodology was primarily influenced by two key factors: (1)
45 338 Strauss and Corbin's (2015) detailed procedures for developing theory through semi-structured
46 339 interviews and participatory observations; and (2) Pandit's (1996) technique for applying GT with the
47 340 assistance of qualitative analysis software (Computer Assisted/Aided Qualitative Data Analysis,
48 341 CAQDAS).
49
50
51
52
53

54 342 To develop GT, this research employed two primary strategies as outlined by Strauss and Corbin
55 343 (2015): the constant comparative method, where the researcher codes and analyses data over time by
56 344 continuously comparing it to generate concepts, and theoretical sampling, which involves seeking new
57 345 cases to refine or expand existing concepts and theory. The coding process was conducted in three
58
59
60

1
2
3 346 phases: open coding, which involved identifying and categorizing raw data; axial coding, which
4
5 347 established connections between categories; and selective coding, which integrated these categories
6
7 348 to construct a coherent theoretical framework. This iterative approach ensured that emerging themes
8
9 349 were validated and supported by the data, contributing to the rigor of the methodology.

10
11 350 The process of creating GT was structured into four stages: research design, data collection, data
12
13 351 analysis, and the confrontation of literature with theory construction. Expert input from various
14
15 352 domains played a crucial role in this research, providing a global perspective while ensuring a deep,
16
17 353 nuanced understanding within each area of expertise.

18 19 354 **3.2 Data collection**

20
21
22 355 Experts from medicine, tourism, consumer advocacy, *app* development, and academia were recruited
23
24 356 based on their domain expertise to provide a well-rounded perspective. The sample selection was
25
26 357 based on theoretical non-probabilistic sampling (Berg, 2014; Pandit, 1996; Shim et al., 2020),
27
28 358 focusing on the expertise area of each expert (refer to Table 1). Participants were recruited through
29
30 359 purposive sampling via email or telephone, ensuring alignment with the study's objectives. All
31
32 360 interviews followed a semi-structured protocol that balanced consistency with the flexibility to
33
34 361 explore emergent themes. Interviews lasted an average of 30-40 minutes and were transcribed in word
35
36 362 files.

36
37 363 [Table 1].

38
39 364 Given the unknown number of experts composing the final sample due to the methodology used, data
40
41 365 collection continued until theoretical saturation was achieved, where no new concepts emerged.
42
43 366 Furthermore, it was decided to disclose the names, job positions, and areas of specialisation of the
44
45 367 experts who participated in the research, considering the ethical considerations highlighted by Gibson
46
47 368 and Brown (2009), as it was essential in this case to specify that the obtained findings are supported
48
49 369 by their participation (refer to Table 1).

50
51 370 The final sample consists of 10 experts whose specialisations can be categorised into the following
52
53 371 areas: medicine, *apps* and cybersecurity, the tourism industry, surveillance of corporate ethical
54
55 372 behaviour and consumer rights advocacy, and academic research. The fieldwork was conducted from
56
57 373 May 2023 to October 2023. The job positions listed for the experts correspond to 2023, and the
58
59 374 research-related roles were always indicated, excluding any additional positions outside the scope
60
375 related to the present investigation. This transparency ensures trustworthiness and reliability.

3.3 Data analysis

Three techniques were employed in the data collection process: semi-structured in-depth interviews, participant observation, and document review.

Semi-structured in-depth interviews were chosen as the primary method due to the exploratory nature of the study and the limited information available to develop a general script (Strauss & Corbin, 2015). Unlike structured interviews, this approach allowed for flexibility, as the questions were not predetermined but evolved naturally during the conversation. For each expert, a tailored interview guide was created using a template as a protocol. On average, the interviews lasted about thirty minutes, with all sessions recorded and transcribed using Teams software. The data was then organized, stored, and analysed using ATLAS.ti 23 Windows, which streamlined the different stages of GT and improved the overall quality of the qualitative research (Strauss & Corbin, 2015). The analysis followed a structured GT approach. First, open coding was applied to identify initial themes and concepts. Next, axial coding established connections between themes, highlighting relationships among identified patterns. Finally, selective coding refined these connections into a unified theoretical framework, ensuring coherence in the study's findings.

To ensure coding reliability, two researchers reviewed the transcripts, achieving an inter-coder agreement of 85% (Strauss & Corbin, 2015). The process was iterative, with constant comparison to refine emerging themes and avoid researcher bias

Participant observation complemented the interviews, given the need for a closer relationship between interviewer and interviewee. This method allowed for a deeper engagement with the participants' stories, capturing the emotions, actions, and interactions that unfolded during their responses, which Strauss and Corbin (2015) consider essential for building GT. The researcher's extensive background in the study area, including work experience at HMHospitales and in the tourism sector, as well as a thorough review of relevant literature, facilitated a meaningful immersion into the interviewees' world.

To enhance the rigor and replicability of this study, multiple validation strategies were employed. Theoretical saturation was ensured by continuing data collection until no novel concepts emerged, guaranteeing comprehensive thematic coverage. Methodological triangulation was applied by cross-validating findings through three independent sources: expert interviews, participant observation, and document analysis, thereby enhancing reliability. Document review was an integral part of the research process. From the outset, both technical and non-technical literature were reviewed. The

technical literature provided a foundation for the study's approach and guided the formulation of the research question. This triangulation of methods (interviews, participant observation, and document review) ensured the validity and trustworthiness of the data and strengthened the overall findings.

4. Findings from literature confrontation and theory construction

The findings contribute to addressing the research gap regarding telemedicine adoption in tourism by highlighting both its practical benefits and critical barriers. Unlike previous studies that focus on telemedicine within domestic healthcare settings, this research presents a unique perspective on how tourists interact with mobile health solutions in foreign environments.

4.1 Factors determining the degree of usefulness

Studies on utilitarian values highlight utility and functionality (Davis, 1989; Moynihan et al., 2010; Park, 2020). Consumers' perceived utility influences their overall perception of devices (Ahn & Park, 2022). Telemedicine satisfaction was defined by experts as the positive attitudes towards the use and value of telemedicine (Guntu et al., 2022). Telemedicine technology is understood as the use of information technologies to facilitate the transfer of medical information for diagnostic, therapeutic, and educational purposes (Rouidi et al., 2022).

The findings indicate that the code "usefulness of medical *apps*" was cited 58 times by experts, highlighting its significance in evaluating the benefits of medical *apps* for health management.

Recent empirical studies have demonstrated that behavioural and emotional engagement with digital platforms significantly influence telemedicine adoption intentions (Dass et al., 2024). Findings suggest that telemedicine adoption is not purely based on technological ease of use but also on emotional factors, such as anxiety, privacy concerns, and perceived data security. The integration of social media and telemedicine services allows users to build trust and familiarity with digital healthcare solutions, which is particularly relevant for tourists who may hesitate to engage with telemedicine due to cross-border healthcare uncertainties.

Expert interviews corroborate findings from recent studies on stakeholder engagement in digital health adoption. Stakeholder involvement plays a critical role in shaping user trust and perception of telemedicine (Ojha & Agarwal, 2025). The alignment of tourism industry leaders with healthcare providers can significantly influence the perceived accessibility and effectiveness of telemedicine solutions for tourists.

1
2
3 436 Expert interviews corroborate recent research emphasizing the role of trust as a critical moderator in
4
5 437 digital health adoption. Studies on online pharmacy adoption suggest that perceived trust significantly
6
7 438 influences consumers' willingness to engage with telehealth services, acting as a crucial determinant
8
9 439 in adoption intention (Saraswat & Singh, 2025). This finding aligns with the study's results, where
10 440 participants highlighted trust in medical professionals, reliability of teleconsultation services, and
11
12 441 compliance with health regulations as key factors influencing their perception of telemedicine *apps*
13
14 442 for travel healthcare.

15
16 443 In the era of digital sensors, there is an ocean of possible multimodal snapshots, episodic, and
17
18 444 continuous data available to inform clinical insight (Pandit et al., 2024). Telemedicine offers the
19
20 445 possibility of bringing health services to the patient, reducing the time needed to establish a diagnosis
21
22 446 and make treatment decisions and improve the continuity of healthcare (Rouidi et al., 2022).

23
24 447 Likewise, the code "care safety", mentioned 31 times, stands out as a key code, being described by
25
26 448 the interviewed experts as the cause of the code "usefulness of telemedicine *apps*", where the
27
28 449 interviewees indicated the importance attributed to the reliability and healthcare safety provided by
29
30 450 telemedicine *apps* for delivering remote medical services and consultations. Telemedicine services
31
32 451 mostly rely on the use of the Internet, telecommunication systems, and cellular devices, so reliability
33
34 452 from a technical point of view is important (Alexandra et al., 2021).

35
36 453 The code "video consultation/ teleconsultation", mentioned 25 times, and defined as a remote call
37
38 454 from a mobile phone or tablet, usually with video (or without video) to the doctor for a consultation,
39
40 455 is another highly mentioned usefulness factor for health management through telemedicine *apps*. With
41
42 456 increasing telemedicine acceptance there was a move from in-person to telemedicine via phone or
43
44 457 video visits (Pandit et al., 2024).

45 458 Additionally, the codes "scheduling appointments", "consulting reports", and "patient follow-up"
46
47 459 emerge as relevant utilities of telemedicine *apps*, cited by most of the interviewees. Below are three
48
49 460 quotes corresponding to each of the last-mentioned codes (refer to Figure 3).

50
51 461 [Figure 3].

470 Carlos Monfort: *“Telephone medical consultation, where the patient calls you and you talk to them.*
471 *Another thing is that also, whether with video support or not, they are very useful...”*

472 **4.2 Identification of the benefits of telemedicine apps usage for tourists**

473 Parasuraman et al. (1988) define reliability as the ability to perform the promised services dependably
474 and accurately. In the health context, reliability is defined as the level of trust that patients have in
475 telemedicine technology, healthcare professionals, and the quality of service (Saigi-Rubio et al.,
476 2016). Telemedicine services depend primarily on the use of the Internet, telecommunication systems,
477 and mobile devices, so reliability from a technical standpoint is important. Reliability affects the level
478 of use because telemedicine users will lose confidence in the system if they cannot use it easily
479 (Schultz, 2018). In addition to technical reliability, a factor influencing patient trust is the success of
480 the health services provided (Lin, 2017), based on the accuracy of the online diagnostic results. The
481 accuracy of such results is important in the choice of health services due to the existence of a life-
482 threatening risk in the case of an incorrect treatment step (Alam et al., 2018). The higher the reliability
483 of the apps and the diagnostic results of the hospital’s teleconsultation apps, the greater the acceptance
484 of the apps by users (Alexandra et al., 2021).

485 The code “use during travel” emerges as a highly relevant utility, being mentioned 45 times,
486 suggesting that the interviewees consider telemedicine a valuable tool while travelling, as it is a cause
487 of the code “usefulness of telemedicine apps.” Due to globalization and privatization of health
488 services, outsourcing healthcare services has resulted in the movement of health professionals and
489 patients across borders for access to available, affordable, and accredited quality healthcare services
490 (Collins et al., 2022). Existing literature on telemedicine and tourism primarily focuses on medical
491 tourism, where individuals travel specifically for healthcare services. However, there is a notable

1
2
3 492 research gap in how telemedicine supports general tourism, where tourists may unexpectedly require
4
5 493 medical assistance. Recent studies emphasize the role of technological and non-technological
6
7 494 innovations in complex services, such as healthcare, where customer participation is crucial for
8
9 495 improving service effectiveness (Samuelsson, 2023). Like tourism, the healthcare industry benefits
10 496 from integrating digital innovations and consumer engagement to enhance service performance and
11
12 497 adoption.

13
14 498 Despite these insights, few studies have examined how telemedicine apps function in travel settings,
15
16 499 particularly when tourists encounter unfamiliar healthcare systems, language barriers, or limited
17
18 500 medical access. This study aims to bridge that gap by identifying the key challenges and opportunities
19
20 501 in telemedicine adoption among tourists. Additionally, Hanefeld and Smith (2019) highlight that
21
22 502 medical tourism has become a lucrative sector for nations and private hospitals, contributing to foreign
23 503 exchange revenue, addressing skill shortages, and enhancing healthcare system efficiency.

24
25
26 504 Next, the code “video consultation/ teleconsultation”, mentioned 25 times, is revealed as one of the
27
28 505 key factors forming part of healthcare safety when travelling, by allowing the possibility of
29
30 506 communicating and receiving remote assistance from a doctor in your language. Therefore, it can be
31 507 considered that the healthcare security provided to the interviewees using the telemedicine *apps* when
32
33 508 they travel is a common denominator among all of them. Video and phone consultations with a
34
35 509 familiar doctor provide a sense of security for tourists (see Figure 4). Teleconsultation allows tourists
36 510 to access medical advice in their native language, reducing anxiety about navigating foreign healthcare
37
38 511 systems. This immediate access to healthcare helps mitigate health risks associated with delayed
39
40 512 treatment. Furthermore, telemedicine *apps* facilitate real-time health monitoring and electronic
41
42 513 medical record access, improving confidence in managing pre-existing conditions while traveling.

43
44 514 [Figure 4].

45
46
47 515 The findings reveal two critical barriers affecting telemedicine adoption among tourists. First,
48
49 516 usability challenge: older users frequently encounter complex interfaces and unfamiliar navigation,
50 517 underscoring the need for adaptive designs and user-friendly onboarding features. Second, privacy
51
52 518 concerns: while some users trust telemedicine, others remain hesitant due to data security risks and
53
54 519 international regulatory inconsistencies. Meanwhile, concerns over data security and compliance with
55
56 520 international regulations (e.g., GDPR, HIPAA) impact trust in telemedicine services, particularly in
57 521 cross-border healthcare interactions
58
59
60

1
2
3 522 In addition to technological and usability barriers, communication challenges in telehealth
4
5 523 consultations further impact user experiences. Seuren et al. (2024) highlight delays in audio-visual
6
7 524 synchronization, difficulties in mutual engagement, and conversational disruptions, which can reduce
8
9 525 patient trust and clinician effectiveness. This issue is particularly problematic for tourists, who may
10 526 already face language barriers and unfamiliar healthcare settings. Addressing these limitations
11
12 527 requires improvements in telehealth interface design, including real-time speech translation,
13
14 528 optimized connectivity, and enhanced visual-audio synchronization to ensure seamless interactions
15 529 between patients and healthcare providers.
16
17

18 530 Abdelwahed et al. (2024) emphasize that healthcare professionals' perceptions and attitudes
19
20 531 significantly influence the adoption of digital health technologies. Their study found that
21
22 532 professionals' digital literacy, trust in e-health systems, and perceived ease of use are major
23 533 determinants of telemedicine adoption. However, barriers such as reluctance to transition from
24
25 534 traditional healthcare models, cybersecurity concerns, and the digital divide persist, particularly in
26
27 535 regions with limited e-health training and infrastructure. These findings reinforce the necessity of
28
29 536 user-centred design strategies, targeted education programs, and robust security frameworks to
30 537 enhance telemedicine adoption, particularly in travel settings.
31
32

33 538 Regarding data privacy, the study reveals a dichotomy: while some users trust telemedicine systems,
34
35 539 others remain hesitant due to potential security risks. Implementing blockchain-based data encryption,
36 540 AI-driven anomaly detection, and standardized compliance frameworks could mitigate these
37
38 541 concerns, ensuring that medical data remains protected across jurisdictions. Addressing these issues
39
40 542 is essential to fostering greater acceptance of telemedicine as a reliable healthcare alternative for
41
42 543 tourists.
43

44 544 **4.3 Factors determining the drawbacks of telemedicine *apps* usage**

45
46

47 545 Determining the disadvantages of telemedicine *apps* from the user's perspective is crucial, especially
48
49 546 regarding their impact on healthcare safety and utility. A rewarding experience is critical to keep the
50 547 user pleased and motivated over time, especially in health-related *apps* (Biduski et al., 2020).
51
52

53 548 One of the most prominent barriers identified in this study is the technological complexity faced by
54
55 549 older adults, creating a substantial barrier to the adoption of telemedicine *apps* among older adults.
56 550 While younger users generally navigate these platforms with ease, older individuals often struggle
57
58 551 with user interfaces that are not intuitive, multi-step authentication processes, and unfamiliar digital
59
60 552 interactions. These usability challenges discourage engagement and, in some cases, lead to complete

1
2
3 553 avoidance of telemedicine solutions, ultimately limiting their effectiveness in providing accessible
4
5 554 healthcare during travel. Addressing these barriers requires user-centered design strategies, such as
6
7 555 simplified interfaces, voice-activated navigation, and step-by-step onboarding tutorials (Blok et al.,
8
9 556 2020).

10
11 557 In addition, privacy concerns regarding medical data security were cited by multiple experts, although
12
13 558 opinions on their severity varied. While some participants expressed confidence in telemedicine
14
15 559 security measures, others raised concerns about data violations, unauthorized access, and compliance
16
17 560 with international privacy regulations such as GDPR and HIPAA. These concerns are particularly
18
19 561 relevant in cross-border healthcare interactions, where legal protections and data governance
20
21 562 structures differ significantly between countries. A more transparent approach, including clear user
22
23 563 consent protocols, encryption of medical records, and integration with secure digital identity
24
25 564 verification systems, could enhance trust and encourage wider adoption of telemedicine among
26
27 565 tourists.

28 566 The codes “data privacy” and “elderly person” emerge as central codes in the “inconveniences”.
29
30 567 Therefore, codes such as usefulness, use while travelling, or healthcare safety are not associated with
31
32 568 “inconveniences”, so the relationship between usefulness and healthcare safety of telemedicine *apps*
33
34 569 and their use while travelling remains uncompromised, which is the objective to be determined in this
35
36 570 section.

37 571 Notably, the code “elderly person” is cited by all interviewees, understood as the greatest
38
39 572 inconvenience when using telemedicine *apps*. The code “data privacy”, cited 13 times, is revealed as
40
41 573 an inconvenience but not a determinant for the use of telemedicine *apps* (refer to Figure 5).

42
43 574 [Figure 5].

6 583 Estefanía Artetxe: *“If I have the banking apps where I have everything downloaded, how am I going*
7 *to be afraid of that? Moreover, you can’t just log in, you need a user code, and usually for data*
8 584 *privacy, they tell you they will send a code to your phone for you to enter and confirm that it’s you*
9 585 *are logging in and not someone else, just like online banking.”*
10
11
12

13
14 587 Perednia et al. (1995) suggest that the ultimate success of telemedicine requires an adopting
15 588 organisation to address not only technological challenges but also management issues, including user
16 589 acceptance of this technology. Therefore, it is important to study the essential factors for its acceptance
17 590 and use by healthcare professionals (Rouidi et al., 2022). However, to better understand the
18 591 technology acceptance of older people, researchers concluded in several studies, that additional
19 592 variables should be included, related to biophysical and psychosocial characteristics, abilities and
20 593 problems experienced (Blok et al., 2020).
21
22
23

26

27 594 **4.4 Linkage between the usage of telemedicine apps and the perceived healthcare safety**

28
29

30 595 It is worth noting the connection between the codes “travel insurance” and “Tourism Industry and
31 596 telemedicine”, which highlights the relationship between healthcare safety, telemedicine apps, and
32 597 travel, with the purchase of travel insurance, promoted or facilitated through the tourism industry
33 598 (refer to Figure 6). Below are three experts that refer to the above:
34
35
36

37
38 599 [Figure 6].
39

40 600 Expert 1:
41
42

43 601 Alicia de la Cuerda: *“Well, in that travel insurance, you have, for example, many people who travel*
44 *who don’t have medical insurance, but maybe for an international travel situation. Imagine, you go*
45 602 *to the United States, and you have any problem, so you take out travel insurance that involves a series*
46 603 *of things.”*
47
48
49

50
51 605 Expert 2:
52
53

54 606 Carlos Monfort: *“Let’s see, I think if you are going to travel and have some fear, you take out medical*
55 607 *travel insurance. What can happen with the app? It might give you a false sense of security. That is,*
56 608 *okay, it shows that my blood pressure is high, and I have a headache, I go to a hospital, okay? So, it’s*
57
58
59
60

1
2
3 609 *great, but if you haven't taken out medical insurance and can't access it, then, it's like everything, it's*
4
5 610 *how you use it..."*
6

7
8 611 Expert 3:
9

10 612 Reinald Gimeno: *"Well, in destinations where healthcare management is more complicated... for*
11 *example, in the United States, where we know what healthcare coverage is like... you don't really*
12 *know how far your insurance goes... or in more distant countries... or in countries where you might*
13 *contract some disease..."*
14
15
16 615

17
18 616 The qualitative research was conducted with the support of the ATLAS.ti software package for the
19 construction of the TF, from which 271 quotes, four CF (disadvantages of telemedicine *apps*,
20 usefulness for health management, healthcare safety while travelling, and advantages of telemedicine
21 *apps*) and 111 codes were obtained. Among all the codes resulting from the research, 60 lack
22 618 theoretical saturation, and 13 have a frequency of values equal to or above 14 (refer to Table 2).
23
24
25 620

26
27
28 621 [Table 2.]
29

30 622 **5. Conclusions**

31
32

33 623 This study directly addresses an unresearched area in both tourism and healthcare research by
34 examining telemedicine's role in supporting tourists. While telemedicine is well-documented in
35 624 traditional healthcare settings, its potential to enhance tourist safety, improve access to emergency
36 healthcare, and reduce travel-related health risks has received little scholarly attention. By
37 625 highlighting usability concerns, security issues, and adoption barriers, this study paves the way for
38 626 future research and policy improvements in telemedicine tourism. For example, the role of tourists'
39 behavioural intentions, mediated by tourist satisfaction, remains largely unexamined in hospitality and
40 627 tourism research (Majeed et al., 2020). Additionally, telemedicine is rapidly becoming a key service
41 within information and communication technologies (ICT), significantly impacting traditional
42 628 healthcare delivery mechanisms (Kamal et al., 2020).
43
44 629
45
46 630
47 631
48 632
49
50

51 633 The research addressed four specific objectives: assessing the usefulness of telemedicine *apps* for
52 health monitoring, identifying their benefits for tourists, analysing the drawbacks influencing utility
53 634 and safety perceptions, and exploring the relationship between telemedicine *app* usage and perceived
54 healthcare safety during travel. These objectives provided a focused framework for analysing expert
55 635 insights and generating actionable recommendations.
56
57 636
58
59 637
60

Several important theoretical contributions have emerged from this research, particularly in understanding the factors that influence the adoption and use of telemedicine *apps* by tourists. These factors include perceived usefulness, ease of use, *apps* during travel, advantages and disadvantages, and the level of healthcare security provided by these *apps*. Despite a strong desire to meet travel needs, tourists may face obstacles such as perceived risks that could deter them from using telemedicine services (Kim et al., 2021). Over the past decade, the involvement of consumers in healthcare processes has gained increasing attention, with positive expectations for its impact on healthcare outcomes (Mirzaei & Esmaeilzadeh, 2021). Moreover, bidirectional communication is recognized as a fundamental feature of intelligent services (Gao & Huang, 2019).

6. Implications

6.1 Research implications

This study provides a theoretical framework to understand the intersection of healthcare, telemedicine *apps*, and tourism. It suggests that integrating telemedicine services into travel-specific *apps* can significantly enhance the travel experience and improve medical safety for tourists. Additionally, telemedicine *apps* have the potential to mitigate travel-related health anxieties and encourage proactive health management among tourists, contributing to public health improvements.

6.2 Practical implications

The integration of telemedicine *apps* within the tourism industry carries wide-reaching implications for various professionals and sectors. Healthcare professionals, including physicians and other medical practitioners, could find new employment opportunities in telemedicine, especially those with expertise in emergency medicine, primary healthcare, and teleconsultation. As demand for telemedicine services increases, there will likely be a need for specialized training programs to ensure that healthcare providers can meet the specific needs of tourists and maintain high-quality service. Multilingual teleconsultation services and emergency medical coordination tailored to tourists' needs could further enhance adoption and satisfaction.

Information technology specialists will be instrumental in this integration, tasked with developing and maintaining secure, user-friendly telemedicine platforms tailored to the tourism industry. Ensuring data security and the seamless interoperability of these platforms with existing tourism information systems will be crucial to their success.

1
2
3 667 Tourism professionals, such as travel agents, hotel managers, and tour operators, will need to adapt
4
5 668 by integrating telemedicine services into their offerings and effectively communicating these benefits
6
7 669 to clients. This adaptation can enhance the overall appeal and safety of tourism packages.
8

9
10 670 Consultants and regulatory experts will also play a vital role, advising tourism businesses on the legal
11 671 and regulatory aspects of providing telemedicine services to tourists. This includes ensuring
12
13 672 compliance with data privacy laws and both local and international medical regulations to deliver
14
15 673 legally sound and ethically responsible services. Integrated solutions, such as travel insurance with
16 674 telemedicine services, could also increase consumer confidence and adoption.
17
18

19 675 Finally, researchers and academics may find new opportunities to study the impact of telemedicine
20
21 676 on the tourism industry, exploring best practices for its implementation and assessing its effectiveness
22
23 677 in various contexts. This could lead to the development of specialized academic programs and training
24 678 courses that bridge telemedicine and tourism, preparing future professionals for this evolving field.
25
26

27 679 **6.3 Social implications**

28
29

30 680 From a policy perspective, integrating telemedicine within tourism requires careful consideration of
31 681 health data privacy regulations such as the GDPR in Europe and HIPAA in the United States. In
32
33 682 addition to regulatory alignment, the ethical and social implications of telemedicine adoption require
34
35 683 careful examination. Research suggests that telemedicine adoption policies should prioritize digital
36
37 684 equity, ensuring that lower-income and marginalized tourist populations have access to affordable and
38 685 culturally sensitive healthcare solutions (Chanda et al., 2025). Without targeted efforts to bridge
39
40 686 digital health disparities, telemedicine risks becoming an exclusive service accessible only to tech-
41
42 687 savvy or high-income tourists, rather than a universally beneficial healthcare solution.
43

44 688 These frameworks administrate the collection, storage, and transfer of sensitive medical information,
45
46 689 making compliance essential for international telemedicine services. Ensuring secure cross-border
47
48 690 data exchange through encrypted transmission protocols, implementing standardized consent
49
50 691 mechanisms, and promoting interoperability between national healthcare systems are critical steps to
51 692 address regulatory inconsistencies and enhance patient trust. According to Holly et al. (2023),
52
53 693 effective health data governance (HDG) should not only prioritize security but also integrate equity
54
55 694 and rights-based principles to ensure inclusivity in digital health solutions. Their study highlights the
56
57 695 need for globally unified policies that balance data protection with the efficient use of medical data
58 696 for public health benefits. Policymakers should collaborate with telemedicine providers, tourism
59
60 697 stakeholders, and cybersecurity experts to develop comprehensive data-sharing agreements,

1
2
3 698 regulatory strategies, and robust compliance measures that align with global standards for medical
4
5 699 data protection, ensuring equitable and ethical handling of health data across jurisdictions
6

7
8 700 The role of social media engagement in promoting telemedicine services is increasingly relevant,
9
10 701 particularly in the context of public health crises (Dass et al., 2024). Studies indicate that social media-
11 702 driven digital health campaigns can reduce anxiety-related resistance to telemedicine by offering
12
13 703 reliable, verified information on its benefits and regulatory safeguards. However, ethical concerns
14
15 704 arise regarding the use of fear-based digital marketing to promote telemedicine services, highlighting
16
17 705 the need for ethical advertising standards and transparent data governance frameworks. Ensuring that
18 706 social media-driven telemedicine adoption strategies are evidence-based and ethical is critical for
19
20 707 fostering trust, accessibility, and equitable healthcare delivery for tourists and vulnerable populations.
21

22
23 708 Beyond improving healthcare access for tourists, telemedicine raises ethical concerns regarding
24
25 709 digital inclusion, accessibility for marginalized groups, and data sovereignty. Research suggests that
26
27 710 ethical telemedicine adoption requires a stakeholder-centred approach to ensure equitable service
28
29 711 delivery and mitigate digital disparities (Ojha & Agarwal, 2025). Tourism stakeholders must advocate
30
31 712 for policies that promote ethical AI-driven healthcare solutions, ensuring fairness in healthcare
32
33 713 provision across diverse tourist demographics.
34

35
36 714 In summary, the integration of telemedicine *apps* and services into the tourism industry could have
37
38 715 profound implications, driving innovation and creating new professional pathways across a range of
39
40 716 disciplines. By fostering collaboration among tourism stakeholders, healthcare providers, and
41
42 717 technology developers, telemedicine *apps* can redefine global travel safety standards. The findings
43
44 718 highlight the urgent need for integrated telehealth solutions in tourism, addressing usability, privacy,
45
46 719 and accessibility challenges. Future research should explore cross-border regulatory frameworks, AI-
47
48 720 driven language solutions, and digital health training for tourists to maximize telemedicine's potential
49
50 721 as a standard component of global travel infrastructure.
51

52 722 **6. Limitations and future research lines**

53
54 723 The integration of telemedicine *apps* into the tourism industry offers valuable insights but also
55
56 724 presents some limitations that need to be addressed. The availability of empirical data, particularly
57
58 725 from actual tourists, is essential for validating research findings, as studies solely based on expert
59
60 726 perspectives may not fully capture user behaviour or preferences. While this study has contributed
727 significantly to understanding the adoption and use of telemedicine *apps* during travel, it is important
728 to recognize its limitations.

1
2
3 729 One notable limitation is related to the sample size. This research, being a qualitative study, relied on
4
5 730 in-depth insights from a relatively small sample of ten experts. Qualitative studies often use smaller
6
7 731 samples to gain detailed understandings of the subject matter. However, this limited sample size may
8
9 732 not fully represent the broader population, potentially affecting the generalizability of the findings.
10 733 The small sample size also means that the study's conclusions are based on the perspectives of a select
11
12 734 group of experts, which may not capture the full range of experiences and opinions. Moreover, the
13
14 735 lack of input from actual tourists limits the study's ability to explore user experiences and acceptance
15 736 directly. Including tourists in future research would provide a more comprehensive view of how
16
17 737 telemedicine *apps* influence travel behaviour and healthcare safety. To build on these findings, future
18
19 738 research could benefit from a quantitative approach, which would involve a larger and more diverse
20
21 739 sample to test the generalizability of the findings. Additionally, a longitudinal study could provide
22 740 deeper insights into how the adoption and impact of telemedicine *apps* evolve over time, offering a
23
24 741 more comprehensive understanding of their long-term effects and effectiveness.

25
26
27 742 Another limitation is the relatively low usage of telemedicine *apps* among the interviewees. This can
28
29 743 be attributed to the novelty of telemedicine. Although many participants had downloaded telemedicine
30 744 *apps* and used them, their insights into the utility of these *apps* during travel were often based on
31
32 745 assumptions rather than actual experience. Including tourists with firsthand experience using
33
34 746 telemedicine *apps* while traveling could help bridge this gap and provide actionable insights into user
35 747 behaviour. The effectiveness of telemedicine will ultimately depend on widespread adoption and
36
37 748 understanding the factors that influence user acceptance is crucial for promoting its use (Kamal et al.,
38
39 749 2020).

40
41 750 Despite these limitations, the study provides substantial academic contributions to the tourism and
42
43 751 hospitality industry. It offers insights into the factors shaping the adoption and use of telemedicine
44
45 752 *apps* during travel. For instance, the role of tourists' behavioural intentions and tourist satisfaction as
46
47 753 a mediator has not been thoroughly explored in hospitality and tourism research (Majeed et al., 2020).

48
49 754 Future research could explore several areas. One potential direction is examining how the availability
50
51 755 of telemedicine services through mobile *apps* affects tourists' travel behaviour and decisions, such as
52
53 756 destination choice, travel duration, and frequency. Research has shown that ICT can influence travel
54
55 757 in various ways, including affecting the location of residences and travel mode choices (Mouratidis et
56 758 al., 2021). Smartphone *apps*, with their advanced functions and real-time location-specific data, can
57
58 759 provide valuable information on destinations and travel solutions (Jamal & Habib, 2020).

59
60

760 Another area for future research is the development of telemedicine services specifically designed for
761 tourists. This could involve providing multilingual medical assistance, connecting tourists with local
762 doctors, and coordinating with emergency services. Telemedicine is emerging as a significant ICT
763 service with notable effects on traditional healthcare systems (Kamal et al., 2020) and addressing the
764 unique needs of tourists could enhance its effectiveness.

765 Exploring collaboration models between tourism businesses, such as hotels, airlines, and travel
766 agencies, and telemedicine providers, including hospitals, insurers, and public health services, is also
767 a promising research avenue. Integrated packages that include remote medical care could enhance the
768 tourist experience. The telemedicine–medical tourism system encompasses various components,
769 including tourists, destinations, transit regions, tourism industries, telemedicine support systems, and
770 healthcare organizations (Gu et al., 2021).

771 From a managerial perspective, integrating healthcare services with telemedicine *apps* could
772 significantly enhance tourists' experiences and improve healthcare safety during their journeys. This
773 integration supports the simultaneous engagement in activities such as travel and telework, online
774 socialization, or educational and recreational pursuits (Mouratidis et al., 2021). Additionally, a tech-
775 savvy attitude is positively associated with effective trip planning and improved travel outcomes
776 (Jamal & Habib, 2020).

International Journal of Pharmaceutical and Healthcare Marketing

Review

Manuscript Number: IJPHM-10-2024-0114

Title: "Telemedicine apps and their influence on the tourism industry. A qualitative study".

Dear Reviewers,

We sincerely appreciate the time and effort you have dedicated to reviewing our manuscript "Telemedicine apps and their influence on the tourism industry: A qualitative study" submitted to the *International Journal of Pharmaceutical and Healthcare Marketing*. Your constructive feedback has been invaluable in refining our work, and we have carefully addressed each of your suggestions to enhance the manuscript's clarity, depth, and rigor.

We have thoroughly revised the manuscript to incorporate your insightful recommendations. The key changes, highlighted in the revised version, include the following:

- **Expanded literature review:** We integrated recent studies (post-2023) on telemedicine trends, regulatory frameworks (GDPR, HIPAA), and applications beyond tourism, including chronic disease management and emergency healthcare. These additions ensure our discussion reflects the latest advancements in the field.
- **Enhanced methodology:** We provided greater detail on the interview process, including recruitment, structure, and duration (30-40 minutes per interview). We

also elaborated on the coding process (open, axial, and selective coding) and included validation measures such as triangulation and theoretical saturation to strengthen methodological rigor and transparency.

- **Refined results and discussion:** We expanded our analysis of usability barriers for older users, addressing complex interfaces, authentication challenges, and digital literacy concerns. Additionally, we provided a more in-depth discussion of data privacy concerns, including risks of data breaches, regulatory inconsistencies, and compliance with international data protection laws.
- **Strengthened policy implications:** We emphasized the need for standardized consent protocols, secure cross-border data exchange, and collaboration between telemedicine providers and tourism stakeholders. These revisions clarify how regulatory frameworks impact telemedicine adoption in tourism.
- **Improved language and readability:** We revised key sections to improve clarity, eliminate redundancies, and ensure consistency in terminology (e.g., replacing “results” with “findings” where appropriate in alignment with qualitative research conventions).

For clarity and ease of review, we have also prepared a detailed revision table summarizing each of your comments along with our corresponding modifications.

Below, we provide specific responses to each of your observations:

Reviewers' comments and suggestions	Answers and improvements accomplished
Comments Reviewer #1: The paper contains significant original insights,	Reviewer #1: Thank you for your thoughtful feedback and for recognizing the originality and methodological rigor of our work. We have carefully addressed your suggestions:

demonstrates a solid understanding of the literature, and uses appropriate methodologies. However, minor revisions are needed to enhance clarity, expand on certain results, and provide additional references to recent literature.

Reviewer #12: Please check the references.

- Clarity. We have revised key sections to improve clarity, ensuring that complex ideas and findings are more accessible and well-structured.
- Discussion. We have provided additional explanations and contextual analysis to strengthen the interpretation of our results.
- Updated references, We have incorporated recent references to ensure our discussion reflects the latest advancements in the field.

Your comments have been invaluable in refining our manuscript, and we truly appreciate your insights.

Reviewer #2: Thank you for your careful review. We have included updated references. We appreciate your attention to detail, which has helped improve the quality of our manuscript.

1. Originality: Does the paper contain new and significant information adequate to justify publication?

Reviewer #1: The paper presents an interesting and relatively novel exploration of the intersection between telemedicine apps and the tourism industry. This focus is unique, addressing an underexplored area that links healthcare technology with tourism safety and convenience. The research offers valuable insights into how telemedicine apps can enhance tourist

Thank you both for your valuable feedback. We really appreciate your recognition of the originality of our study and its contribution to the connection of telemedicine and tourism; an area that's still underexplored but increasingly relevant.

To Reviewer #1: Thank you very much for your valuable feedback. Your insights have significantly helped us refine our manuscript, particularly in strengthening its justification and highlighting the research gap. Below, we outline the key changes made in response to your comments, which

experiences by improving access to healthcare services during travel.

While the topic is innovative, more emphasis on the specific gaps this study addresses in comparison to existing research would strengthen the justification for publication.

Reviewer #2: The originality is ok.

have notably improved the clarity and contribution of our study.

- Abstract. We emphasized the novelty of our research by explicitly stating the lack of studies on telemedicine's impact in the tourism sector. The abstract now highlights how our study addresses this gap.
- Introduction. We removed generic references to globalization and instead clarified that existing research focuses mostly on medical tourism, overlooking general tourists' healthcare needs.
- Literature review. Section 2.3. We replaced a vague mention of a lack of studies with a more specific explanation of how research has overlooked the everyday healthcare challenges tourists face.
- Methodology. We revised the explanation of our qualitative approach, specifying that it was chosen due to the absence of theoretical models linking telemedicine and tourism.
- Results and conclusion. We explicitly stated that our findings provide new insights into the connection between telemedicine and tourism.

To Reviewer #2: Thank you for your feedback. We appreciate your acknowledgment that the originality of our study is solid. While the topic is still emerging, we have made some refinements to better highlight the specific gaps our

	research fills and reinforce its contribution to the field.
<p>2. Relationship to Literature: Does the paper demonstrate an adequate understanding of the relevant literature in the field and cite an appropriate range of literature sources? Is any significant work ignored?</p> <p>Reviewer #1: The paper demonstrates a strong The article demonstrates a broad overview with relevant literature, referencing key works on telemedicine, healthcare technologies, and tourism. The inclusion of theories like the Technology Acceptance Model (TAM) and Unified Theory of Acceptance and Use of Technology (UTAUT) is appropriate and reflects a solid understanding of the technological adoption literature. However some revision is needed</p> <p>1. Some sections could benefit from citing more recent works (post-2023) especially trend and technology review.</p> <p>2. A comparison with similar studies in telemedicine for other industries (beyond tourism) might provide a broader context.</p> <p>Reviewer #2: There is a need to extend literature section. The author briefly showed the literature section.</p>	<p>Reviewer #1 and Reviewer #2: We appreciate your insightful comments on the literature review. To address your suggestions:</p> <ul style="list-style-type: none"> • We have incorporated multiple post-2023 studies, particularly on emerging telemedicine trends, technology adoption, and regulatory frameworks, ensuring the literature is up to date. • We have expanded the discussion to include telemedicine adoption in other sectors. • We have added further analysis on technological innovations, including IoT, AI-driven diagnostics. <p>These enhancements strengthen the theoretical foundation and contextual relevance of our study. Thank you for your valuable feedback.</p>
3. Methodology: Is the paper's	To Reviewer #1: Thank you for your

argument built on an appropriate base of theory, concepts, or other ideas? Has the research or equivalent intellectual work on which the paper is based been well designed? Are the methods employed appropriate?:

Reviewer #1: More details on the interview process, coding steps, and validation measures could enhance transparency and replicability.

Reviewer #2: Methodology section was shown perfectly.

insightful feedback. Your suggestion to provide more details on the interview process, coding steps, and validation measures has been extremely valuable in improving the transparency and replicability of our study.

We have made the following revisions:

- Interview process: We have also clarified that interviews followed a semi-structured protocol, lasted between 30 to 40 minutes.
- Coding steps: The description of our Grounded Theory approach has been expanded to detail the three coding phases (open, axial, and selective) and their role in theory development.
- Validation measures: We have added a dedicated subsection outlining the strategies used to ensure methodological rigor, including theoretical saturation, triangulation across three data sources.

These revisions significantly strengthen the methodological section and improve the study's clarity and reproducibility. We sincerely appreciate your constructive feedback, which has helped us refine our research and better communicate its contributions.

To Reviewer #2: Thank you for your positive feedback on the methodology section. We appreciate your recognition of its clarity and structure. While no major changes were necessary, we have further refined certain

	<p>aspects to enhance transparency and replicability. Specifically, we expanded on the interview process, detailed the coding steps, and added a section on validation measures to reinforce methodological rigor. Your assessment reassures us that the methodological framework is well-structured and effectively presented. We truly appreciate your time and review.</p>
<p>4. Results: Are results presented clearly and analyzed appropriately? Do the conclusions adequately tie together the other elements of the paper?</p> <p>Reviewer #1: The discussion of drawbacks, particularly data privacy and elderly users' difficulties, could be expanded with more robust analysis.</p> <p>Reviewer #2: 1. In qualitative research, we use the term "findings" instead of "result" Further, I suggest to include a table for the participants'</p>	<p>To Reviewer #1: Thank you for your valuable feedback. Your suggestion to expand the discussion on the drawbacks of telemedicine apps, particularly regarding data privacy and usability challenges for older users, has been extremely helpful in strengthening our analysis. In response, we have made the following key improvements:</p> <ul style="list-style-type: none"> Expanded the discussion on usability barriers for older users, detailing specific difficulties such as complex user interfaces, multi-step authentication, and digital literacy challenges. Provided a more in-depth analysis of data privacy concerns, acknowledging the variation in user trust and highlighting potential risks such as data breaches, unauthorized access, and compliance with international regulations (e.g., GDPR, HIPAA). <p>These revisions enhance the clarity, and applicability of our findings, directly addressing your recommendation and improving the overall impact of the study. We sincerely appreciate your thoughtful</p>

	<p>review, which has helped us refine and strengthen our work.</p> <p>To Reviewer #2: Thank you for your valuable feedback. Following your suggestion, we have substituted the term “results” with “findings” where pertinent and in alignment with qualitative research.</p> <p>Additionally, regarding your recommendation to include a table for participants, we would like to highlight that “Table 1. Sample of experts” is already included in the manuscript. This table is mentioned and explained in Section 3.2 (Data Collection).</p> <p>We truly appreciate your insights, which have helped refine our manuscript. Thank you again for your thoughtful review and constructive suggestions.</p>
<p>5. Implications for research, practice and/or society: Does the paper identify clearly any implications for research, practice and/or society? Does the paper bridge the gap between theory and practice? How can the research be used in practice (economic and commercial impact), in teaching, to influence public policy, in research (contributing to the body of knowledge)? What is the impact upon society (influencing public attitudes, affecting quality of life)? Are these implications consistent with the findings and conclusions of</p>	<p>To Reviewer #1: Thank you for your valuable feedback regarding the policy implications of telemedicine, particularly in relation to data protection regulations such as GDPR and HIPAA. Your suggestion has been instrumental in strengthening the discussion on the regulatory and societal impact of telemedicine in tourism.</p> <p>In response, we have:</p> <ul style="list-style-type: none"> • Improved social Implications section of the abstract, explicitly addressing GDPR (Europe) and HIPAA (United States). • Refined the conclusions section by highlighting the need for secure cross-border data exchange, standardized consent protocols, and interoperability

<p>the paper?</p> <p>Reviewer #1: Consideration of policy implications, such as data protection regulations (GDPR, HIPAA), could deepen the societal impact discussion.</p> <p>Reviewer #2: Implication section is sufficient.</p>	<p>between national healthcare systems to ensure compliance with international regulations.</p> <p>These revisions deepen the discussion on policy implications and ensure that the study's findings are aligned with real-world regulatory frameworks.</p> <p>To Reviewer #2: Thank you for your positive feedback. We appreciate your assessment. While no major revisions were required, we have made enhancements to further strengthen the discussion, particularly regarding policy implications related to GDPR and HIPAA compliance.</p> <p>Your feedback reassures us that the manuscript clearly articulates its implications for research, practice, and society, and we sincerely appreciate your time and thoughtful review.</p>
--	---

6. Quality of Communication: Does the paper clearly express its case, measured against the technical language of the field and the expected knowledge of the journal's readership? Has attention been paid to the clarity of expression and readability, such as sentence structure, jargon use, acronyms, etc.

Reviewer #1: The paper is generally well-written and organized, but there are some areas where clarity and readability could be improved. The technical language is appropriate for the journal's readership, but some sentences are overly complex.

Reviewer #2: Yes, the author(s) used simple and clear language.

To Reviewer #1: Thank you for your insightful feedback on clarity and readability. We appreciate your recognition of the manuscript's organization and technical appropriateness while highlighting areas for improvement.

To enhance readability and precision, we have made the following changes:

- Simplified complex sentences.
- Eliminated redundancies in abstract and findings sections.
- Clarified technical explanations to make key concepts more accessible to the journal's readership.
- Improved transitions and sentence flow for better coherence.

These refinements have made the manuscript clearer, more engaging, and aligned with qualitative research standards while maintaining its depth. Your valuable feedback has significantly contributed to improving the paper's overall quality, and we truly appreciate your time and effort.

To Reviewer #2: Thank you for your positive feedback on the clarity and language of our manuscript.

We are grateful for your thoughtful feedback, which has greatly contributed to strengthening our manuscript. We firmly believe that these revisions have improved the clarity, methodological rigor, and overall quality of our work. We sincerely appreciate your efforts in helping us refine our study for publication.

We look forward to your feedback on the revised manuscript and remain open to any further refinements you may suggest.

Thank you once again for your valuable time and insights.

Warm regards,

The authors
