# ANALYTICAL DETERMINATIONS IN WINE

► pH

► TOTAL ACIDITY

► VOLATILE ACIDITY

► ALCOHOLIC STRENGTH

► SULPHUR DIOXIDE

► FOLIN-CIOCALTEU INDEX

# DETERMINATION OF pH

## Potentiometric method

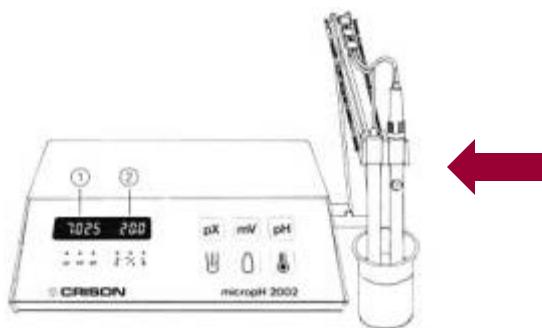

**PURPOSE.-** Potentiometric measurement of pH in wine

**PRINCIPLE.-** The difference in potential between an electrode of pH and the reference electrode both immersed in the sample is measured with a pH-meter.

### Procedure

#### 1. Calibration

- Connect the pH-metro  
Screen: 0000 20°C
- Adjust T
- Calibration with standard sol.  
pH 7.02 y pH4.00

- Dip the electrode until the diafragma is immersed
- Magnetic stirring
- Wash with distilled water and dry between measurements.

#### 2. Measurement

- Dip the electrode into the wine: 15 s. Read the pH
- Carry out two determinations.
- Note down the results

# DETERMINATION OF TOTAL ACIDITY

## Volumetric method

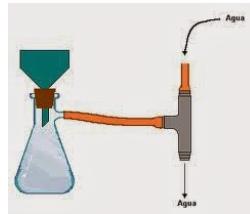

**Principle.-** Titration with NaOH N/10 and bromothymol blue as indicator and comparison with an end-point colour standard or potentiometric titration with a pH-meter to pH= 7,00 ± 0,5.

### Procedure

#### 1. Preliminary operations

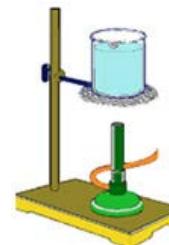

##### Elimination of CO<sub>2</sub> in wine

- 50mL wine
- Kitasato 500mL
- Connection to vacuum pump
- Agitation 1-2'

##### Elimination of CO<sub>2</sub> in H<sub>2</sub>O

- 100 mL H<sub>2</sub>O
- Beaker
- Boiling
- Cooling at room T

##### Calibration of pH-meter

- Sol. standard  
pH 7.02 and pH 4.00

# DETERMINATION OF TOTAL ACIDITY

## Volumetric method

### Titration with bromothymol blue as indicator

#### Obtention of colour standard

NaOH N/10

25 ml Boiled distilled H<sub>2</sub>O  
1 ml bromothymol blue  
10 ml white wine

Yellow

Green

+ 5ml buffer sol. pH 7

Blue-green

#### Titration of wine

NaOH N/10

30 ml Boiled distilled H<sub>2</sub>O  
1 ml bromothymol blue a  
10 ml white wine

Yellow

Blue-green

Comparison of colour

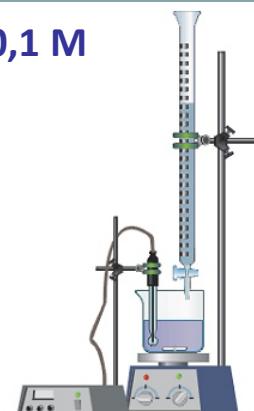

#### Potentiometric titration with a pH-meter

Expressed in: g tartaric acid/L Wine

NaOH 0,1 M

25 ml Boiled distilled H<sub>2</sub>O  
10 ml white wine CO<sub>2</sub> free

- Place it in magnetic stirrer with stirring bar
- Place the calibrated pH electrode
- Magnetic stirring at low speed

Titration End point pH = 7 ± 0,5

# DETERMINATION OF VOLATILE ACIDITY

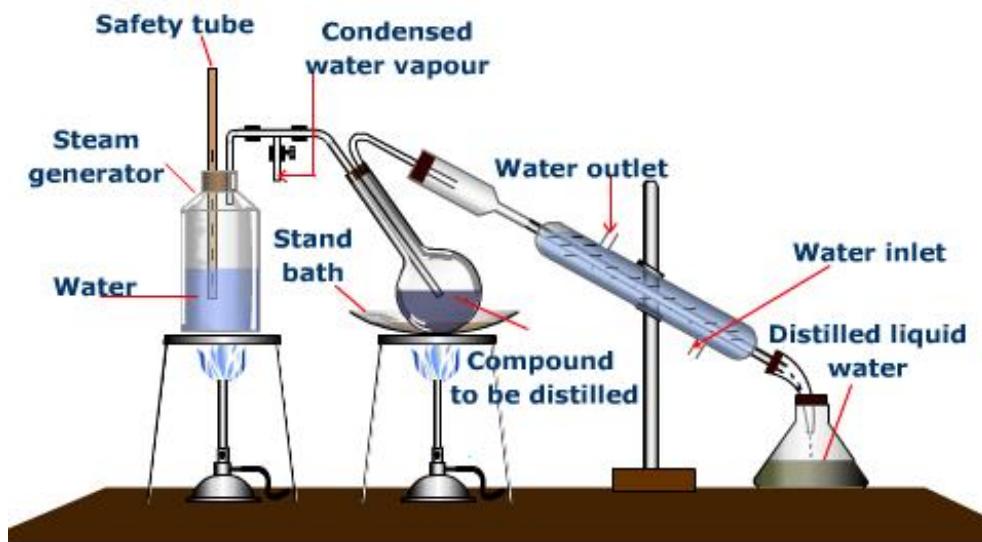

## Volumetric method

**PRINCIPLE.-** Volatile acids (acetic, formic, propionic and butiric) are separated from the wine by steam distillation and titrated using NaOH with phenolphthalein as indicator. The acidity of free and combined sulphur dioxide distilled should be substracted from the acidity of the distillate.

### Procedure

#### Steam distillation

##### Conventional distillator

##### Automatic distillator

Distillation tube:  
20 mL wine  
+ tartaric acid

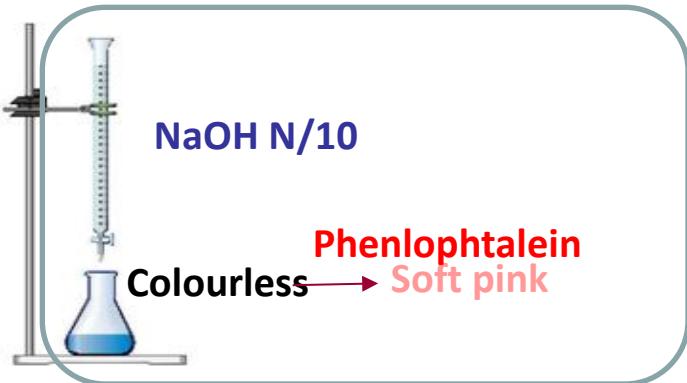

Collecting  
flask  
250 mL

# DETERMINATION OF VOLATILE ACIDITY

## Volumetric method

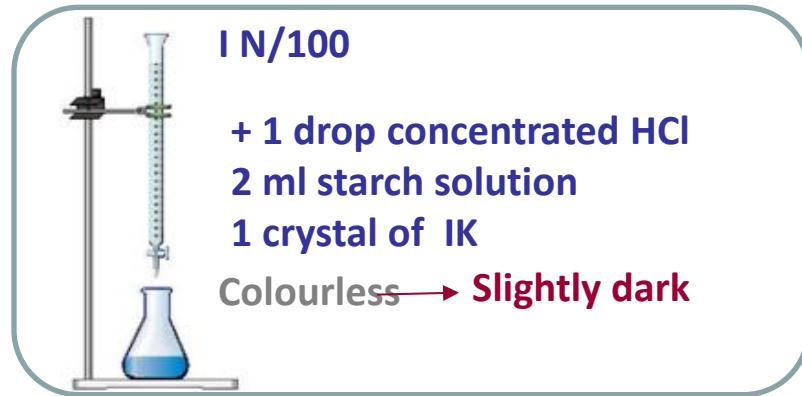

Expressed in:  
g acetic acid/L Wine

### 1. Titration of volatile acidity + free and combined SO<sub>2</sub>

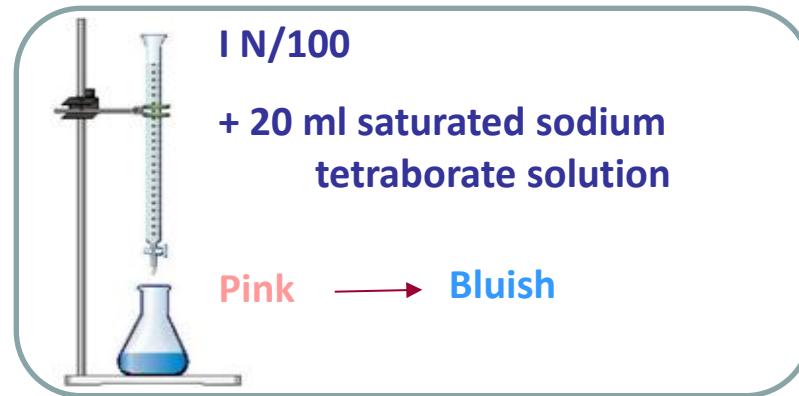

Redox titration

### 2. Titrate the free SO<sub>2</sub>

### 3. Titrate the combined SO<sub>2</sub>

Redox titration

Redox titration

# ALCOHOLIC STRENGTH BY VOLUME

## Measurement using a pycnometer

**PURPOSE.-** Measurement of alcoholic strength by volume (%) in wines

**Principle.-** Distillation of wine made alkaline. Measurement of the alcoholic strength of the distillate with a pycnometer.

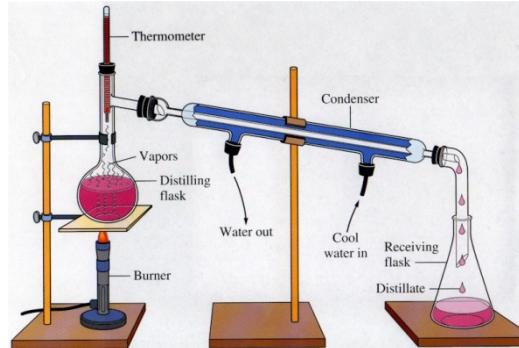

### PROCEDURE

#### 1. Collect the alcohol by distillation

100 mL wine (remove  
CO<sub>2</sub>)

+calcium hydroxide  
+ pieces of inert porous  
material

Apparatus

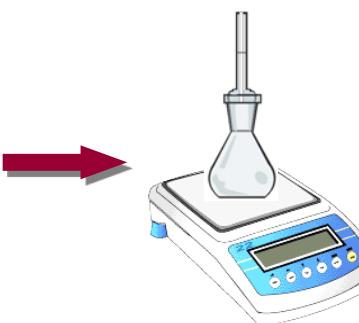

Collect the  
distillate

#### 2. Measurement of the alcohol in the distillate with a pycnometer at 20°C

Weighing of :

- 1) Pycnometer (p)
- 2) Pycnometer+distilled water (p')
- 3) Pycnometer+distillate(p'')

Calculate  
Density

$$D = \frac{p'' - p}{p' - p}$$

WINDISCH Table  
% of alcohol

# ALCOHOLIC STRENGHT BY VOLUME

Measurement using a pycnometer

## WINDISCH TABLES

% alcoholic strength by volume respect to specific gravity at 20º C

Specific gravity	Alcohol % (v/v)	Specific gravity	Alcohol % (v/v)
1,00000	0,00	0,98530	11,00
0,99851	1,00	0,98471	11,50
0,99704	2,00	0,98412	12,00
0,99560	3,00	0,98297	13,00
0,99419	4,00	0,98182	14,00
0,99281	5,00	0,98071	15,00
0,99149	6,00	0,97960	16,00
0,99020	7,00	0,97850	17,00
0,98894	8,00	0,97743	18,00
0,98771	9,00	0,97638	19,00
0,98711	9,50	0,97532	20,00
0,98650	10,00	0,97425	21,00
0,98590	10,50	0,97318	22,00

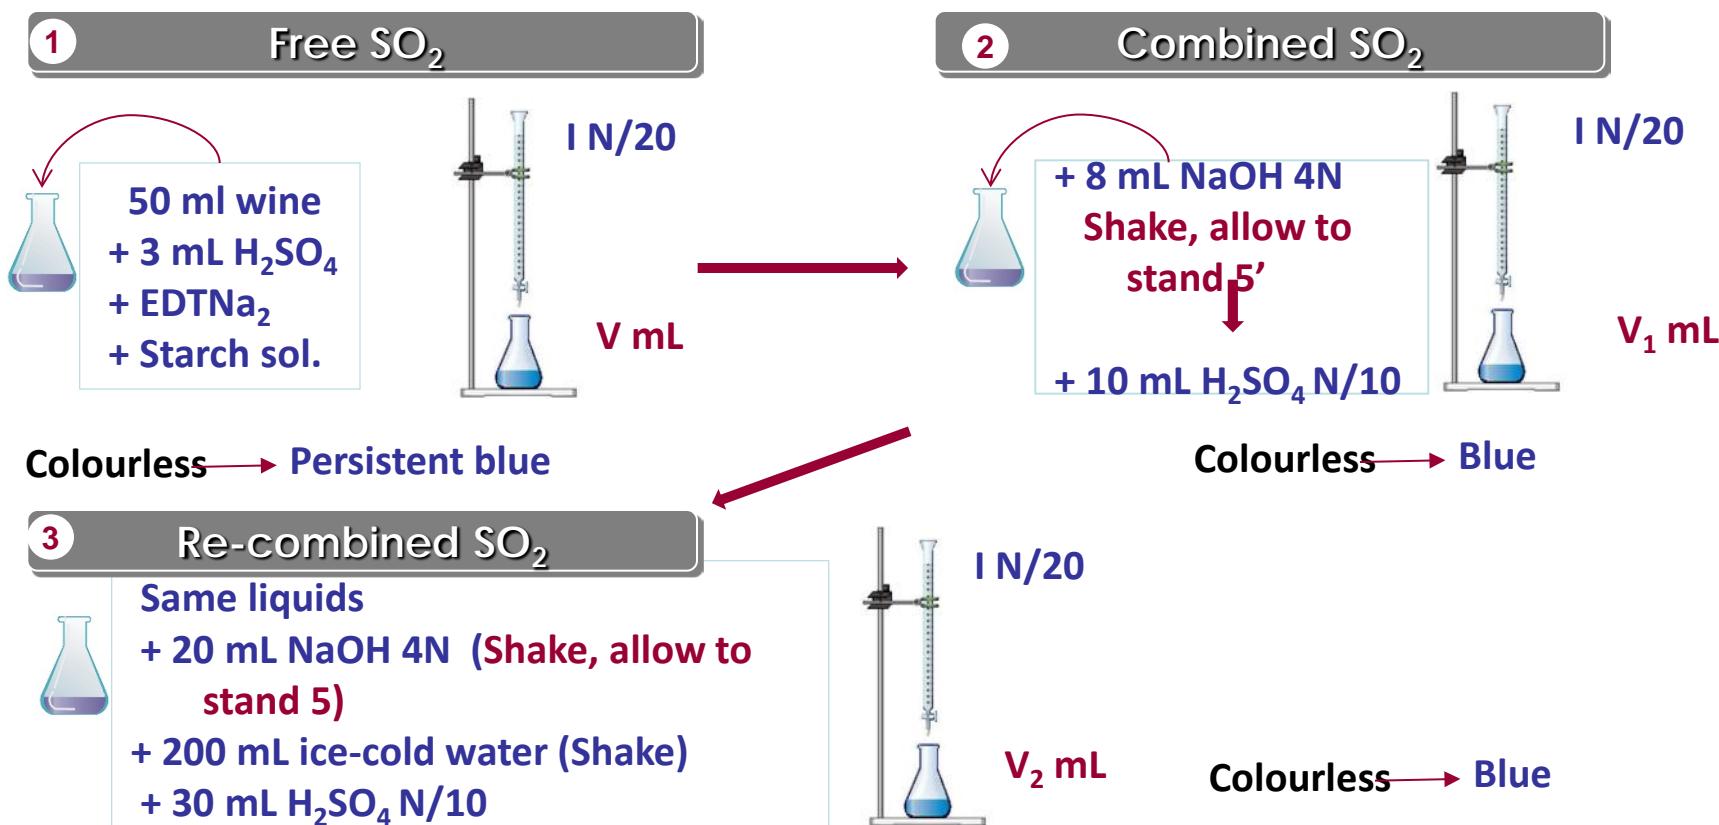

# DETERMINATION OF SULPHUR DIOXIDE

## Double Ripper titrimetric method

**PRINCIPLE** Free sulphur dioxide is determined by direct titration with iodine. The combined sulphur dioxide is subsequently determined by iodometric titration after alkaline hydrolysis. When added to the free sulphur dioxide, it gives the total sulphur dioxide.

### PROCEDURE

#### 1. Titration of free and combined $\text{SO}_2$

# DETERMINACIÓN DE ANHIDRIDO SULFUROSO

Double Ripper titrimetric method

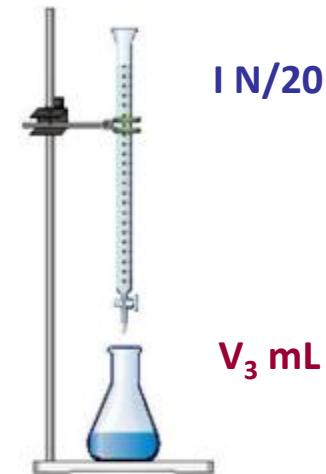

## Procedure

### 2. Titration of other reducing substances

 50 mL wine  
+ 5 mL ethanal sol.  
+ 30 mL H<sub>2</sub>SO<sub>4</sub> N/10

Stopper the flask  
Allow to stand 30'

+ 30 mL H<sub>2</sub>SO<sub>4</sub> N/10  
+ Starch solution

## Redox reaction

Colourless → Blue

## Expression of results

Free SO<sub>2</sub> :  $V - V_3$

Combined SO<sub>2</sub> :  $V_1 + V_2$

Total SO<sub>2</sub> :  $(V + V_1 + V_2) - V_3$

Free sulphur dioxide (mg/L) = 32 (V-V<sub>3</sub>)

Total sulphur dioxide (mg/L) = 32 ((V + V<sub>1</sub> + V<sub>2</sub>)) - V<sub>3</sub>

Expressed in:

Free or combined mg SO<sub>2</sub> /L Wine

# DETERMINATION OF TOTAL POLIPHENOLS

## Folin-Ciocalteu Index

**PRINCIPLE.-** All phenolic compounds contained in wine are oxidized by Folin-Ciocalteu reagent (phosphotungstic and phosphomolybdic acids) which is reduced to a mixture of blue oxides of tungsten and molybdenum . The blue colouration produced has a maximum absorption in the region of 750nm and is proportional to the total quantity of phenolic compounds.

### Procedure

#### Sample

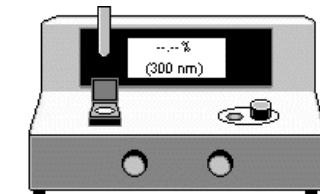

**1 mL Diluted red wine 1/5  
+ 5 mL Folin reagent  
+ 20 mL CaCO<sub>3</sub>**

*Bring to 100 mL dist.H<sub>2</sub>O.*

*Shake  
Allow to stand30'*

#### Blank

**1 mL Distilled H<sub>2</sub>O  
+ 5 mL Folin reagent  
+ 20 mL CaCO<sub>3</sub>**

*Bring to 100 mL dist H<sub>2</sub>O.*

*Shake  
Allow to stand30'*

**Absorbance at 750 nm**

### Expression of results

$$FI = (\text{Abs sample} - \text{Abs blank}) \times 100$$
