Abstract: Identify reelaborated fossils requires knowing the meaning of the term taphonomic reelaboration and the diagnostic criteria that can be used to test such preservation state. In the present work: 1) we make explicit the meaning of the taphonomic terms: accumulation, remotion or reworking, resedimentation and reelaboration, understood as diverse categories of the same taphonomic classification system; 2) showing a model of the process of taphonomic reelaboration; and 3) displaying diverse examples of accumulated (2), resedimented (2) and reelaborated (16) ammonites.

Key words: Palaeontology. Taphonomy. Fossilization. Fossil record.

EXAMPLES OF REELABORATED AMMONITES

Processes and mechanical states of preservation (Complementary file REELABORATION.swf)

Firstly, the meaning of the taphonomic terms: accumulation, removal (remobilization) or reworking, resedimentation and reelaboration, as categories of the same classification system are showed.

Model of taphonomic reelaboration

Using a flow chart, a model of taphonomic reelaboration is presented and several examples of accumulated, resedimented and reelaborated elements are displayed.

Examples of mechanical states of preservation

Links to the figured examples of mechanical states of preservation are available, grouped in three categories: accumulated, resedimented and reelaborated. Two examples of accumulated ammonites and two examples of resedimented ammonites have been described and figured.

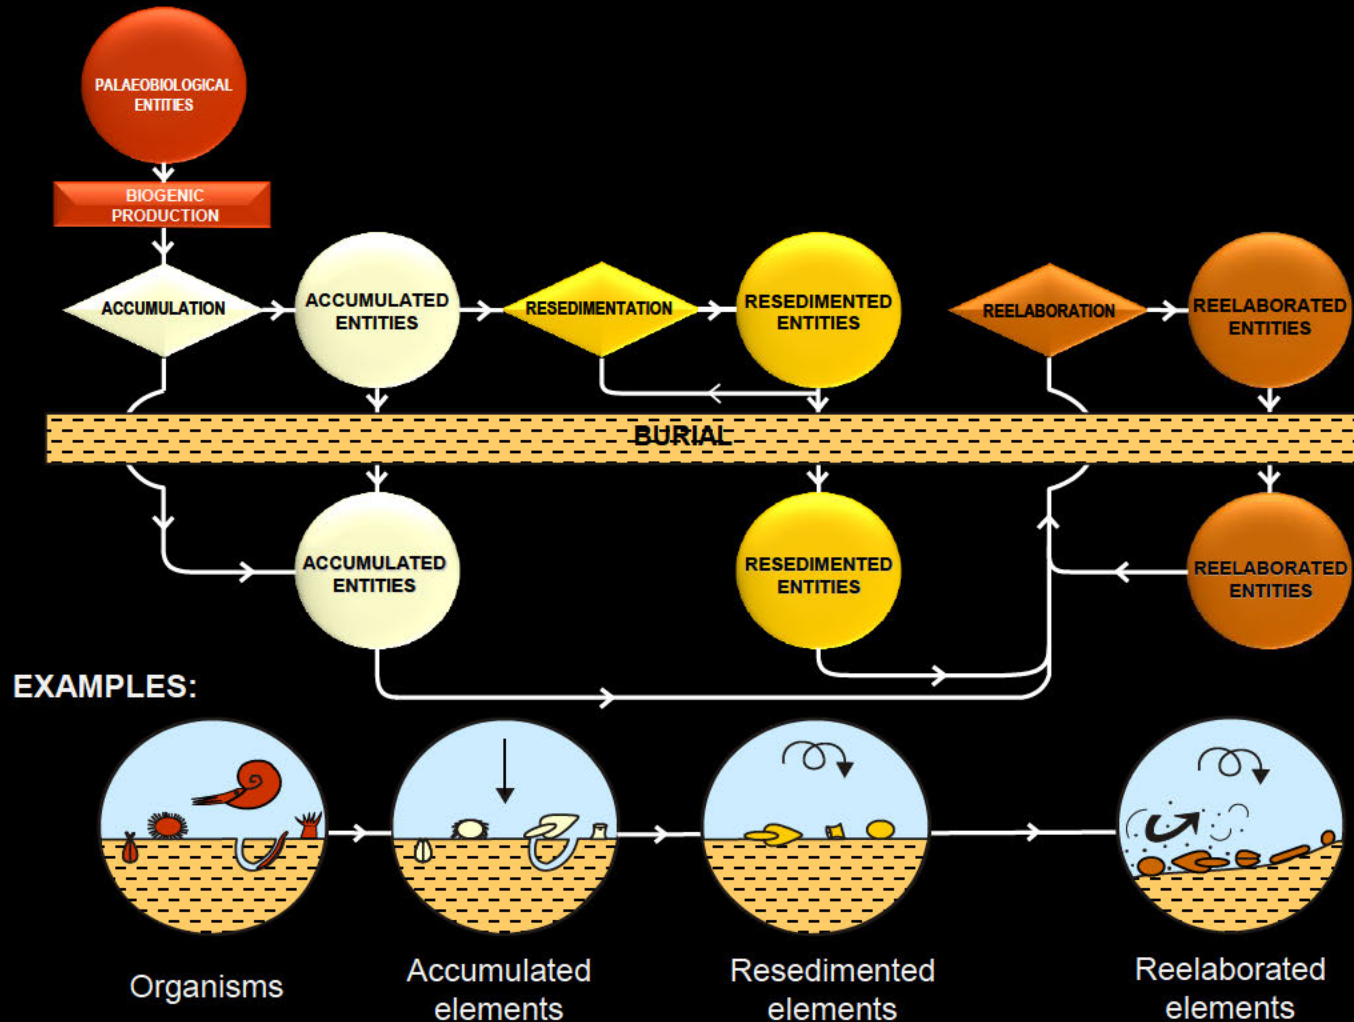

Criteria of taphonomic reelaboration

Ten classes of taphonomic criteria used to diagnose and test reelaborated ammonites have been listed. For each criterion, links to the figured examples have been included, pointing the most relevant and educational.

Processes and mechanical states of preservation

- **Taphonomic accumulation:**
process of incorporation into the lithosphere of taphonomic elements biogenically produced.
- **Taphonomic reworking, remotion or removal:**
displacement of taphonomic elements, previously accumulated, by resedimentation or reelaboration.
 - **Taphonomic resedimentation:**
displacement , before their burial, of taphonomic elements previously accumulated.
 - **Taphonomic reelaboration:**
exhumation and displacement of taphonomic elements previously accumulated or resedimented.

1. Accumulated ammonites

Accumulated landing mark (ALM) and accumulated shell (AS).

2. Resedimented ammonites

Shell and internal mould with ferruginous ooids produced in high energy environments.

3. Resedimented ammonites

Shells and internal moulds showing structural continuity between infill and matrix (SC).

Criteria of taphonomic reelaboration

- Difference in chemical, mineralogical and/or petrological composition between internal mould and sedimentary matrix (*PD*).

- Textural difference between internal mould and sedimentary matrix (*TD*).

- Structural discontinuity between internal mould and sedimentary matrix (*SD*).

- Several phases of sedimentary filling and cementation (*SC*)

- Reverse geopetal structure (*RG*)

- Fracture surface of internal mould (*F*).

- Disarticulation surface of internal mould (*D*).

- Abrasion surface of internal mould (*A*).

- Bioerosion trace of internal mould (*B*).

- Encrusting trace of internal mould (*E*).

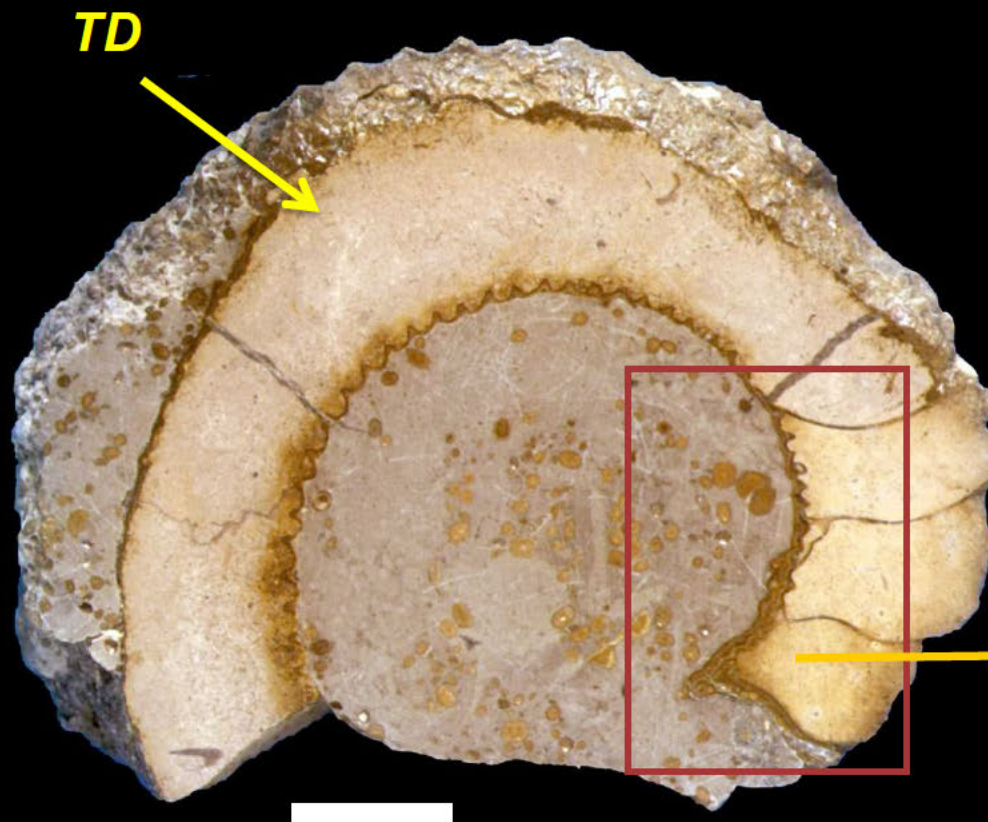

4. Reelaborated ammonites

Phosphatized, concretionary internal moulds (PD), enclosed in marly limestones.

5. Reelaborated ammonites

*Micritic, concretionary internal mould, enclosed in limestone with ferruginous ooids (TD).
Ferruginous encrusting of internal mould (E).*

6. Reelaborated ammonites

Structural discontinuity between internal mould and sedimentary matrix (SD).

Coating by iron-crusts (E).

CRITERIA

7. Reelaborated ammonites

Structural discontinuity between internal mould and sedimentary matrix (SD).

8. Reelaborated ammonites

Structural discontinuity between internal mould and sedimentary matrix (SD).

9. Reelaborated belemnites

Structural discontinuity between internal mould and sedimentary matrix (SD).

10. Reelaborated ammonites

Reverse geopetal sedimentary infill (RG).

11. Reelaborated ammonites

Several phases of sedimentary filling and cementation (SC).

12. Reelaborated ammonites

Disarticulation surface of internal mould (D).

13. Reelaborated ammonites

Truncation facet of internal mould (T).

14. Reelaborated ammonites

Ellipsoidal abrasion facet on the last third of the last preserved whorl (A).

CRITERIA

15. Reelaborated ammonites

Annular abrasion furrow (A).

16. Reelaborated ammonites

Fracture surface of internal mould (F).

17. Reelaborated ammonites

Bioerosion traces of internal mould (B).

18. Reelaborated ammonites

Ferruginous encrusting of internal mould (E).

19. Reelaborated ammonites

Microbial encrusting on a flank of internal mould (E). Ammonite half-lump.

20. Reelaborated ammonites

Remains of bryozoans and oyster encrusting internal mould (E).
